

CRECY AI

One Widget. Six AI Business Solutions.

Master Product, MVP, Architecture, Schema & Widget Integration Plan

Proposed primary domain: crecyai.app

Note: domain availability should be verified before purchase.

Version 1.0 - May 29, 2026

Prepared as a build-ready strategy and technical blueprint for the first Crecy AI SaaS launch.

Table of Contents

- 1. Executive Summary
- 2. Brand & Product Identity
- 3. Market Benchmark Takeaways
- 4. Customer Problems & Six AI Agents
- 5. MVP Boundary & 10/10 Quality Bar
- 6. User Personas & Core Journeys
- 7. Widget Integration Architecture

- 9. AI Engine Architecture
- 10. Database Schema Blueprint
- 11. API Contracts
- 12. Billing, Usage & Entitlements
- 13. Security, Privacy & Abuse Protection
- 14. Admin Operations
- 15. Industry Templates
- 16. Build Roadmap
- 17. Acceptance Criteria
- 18. Pilot Launch Plan
- 19. Final Build Checklist

1. Executive Summary

Crecy AI is a problem-based AI SaaS platform for small businesses. A business owner chooses the problem they want solved - more leads, faster support, quicker quotes, follow-up, paperwork, or sales - and installs one widget that runs the right AI agent for that job.

Core thesis: Crecy AI should not be positioned as a generic chatbot. It is an AI business desk that captures leads, answers customers, creates quote-ready summaries, and reduces repetitive business work.

MVP pillar	Definition
One embeddable widget	A fast mobile-friendly script that can be installed on external websites and configured from the Crecy AI dashboard.
Three production-ready agents	Lead Capture Agent, Customer Service Agent, and Quote Assistant.
Mini CRM	Captured leads, transcripts, summaries, statuses, notes, and suggested next actions.
Business knowledge base	Services, FAQs, pricing notes, service area, hours, policies, and custom knowledge entries.
Usage-based subscription	Plan limits, AI usage metering, overage protection, and fallback form when usage is exhausted.
Admin visibility	Internal oversight for businesses, agents, usage, conversations, billing status, abuse, and AI failures.

Final MVP definition: Lead capture + customer service + quote assistant, powered by business knowledge, delivered through one embeddable widget, managed from a mini CRM dashboard, and protected by usage-based subscriptions.

2. Brand & Product Identity

Item	Decision
Product name	Crecy AI
Proposed domain	crecyai.app (verify availability before purchase)
Product category	AI agents for small-business lead capture, support, quotes, follow-up, paperwork, and sales
Primary customer	Small service businesses that depend on inbound leads and quote requests
Delivery method	One embeddable AI widget plus a web dashboard
Business model	Subscription SaaS with usage limits; no unlimited AI by default

Homepage positioning: Choose the AI agent your business needs today. Capture more leads, answer customers faster, create quotes, and stop losing sales from one simple widget.

- Crecy AI is not a full CRM replacement at launch.
- Crecy AI is not a full enterprise help desk at launch.
- Crecy AI is not a generic AI playground.
- Crecy AI should be marketed around business outcomes, not technical AI features.

3. Market Benchmark Takeaways

Competitors in this space rarely sell one isolated chatbot. Mature products combine several capabilities: AI chat, lead capture, help content, human handoff, booking, CRM syncing, analytics, workflows, and usage-based pricing. Crecy AI should copy the packaging logic, not the complexity.

Competitor pattern	What they usually combine	Crecy AI implication
Support platforms	AI agent, inbox, help center, ticketing, human handoff, reporting	Crecy AI needs handoff and conversation review, but not full ticketing in MVP.
CRM platforms	Lead forms, chatbot, contact records, workflows, campaigns	Crecy AI needs a mini CRM for leads, not a full sales suite.
Social automation tools	DM automation, lead qualification, follow-up, campaigns	Crecy AI can add social later; start with website widget first.
AI chatbot builders	Embeddable agents, knowledge sources, message credits, integrations	Crecy AI should be more problem-based and less generic.
AI SDR products	Qualification, meeting booking, pipeline creation, sales handoff	Crecy AI can borrow the outcome language: capture and qualify opportunities.

Product lesson: The benchmark says the product should be packaged as one widget with multiple business outcomes, not as a vague chatbot builder.

4. Customer Problems & Six AI Agents

Business problem	Agent	MVP depth	Primary output
I am missing leads.	Lead Capture Agent	Full v1	Lead record, summary, contact info, next action
I answer the same questions all day.	Customer Service Agent	Full v1	Answered conversation or human handoff
Quoting takes too long.	Quote Assistant	Full v1	Structured quote-ready intake summary
Customers ghost me.	Follow-Up Agent	Light v1	Suggested follow-up drafts and lead reminders
Paperwork slows me down.	Paperwork Assistant	Light v1	Structured notes from messy messages/forms
I want more sales.	Sales Assistant	Light v1	Service/product recommendation and CTA guidance

Lead Capture Agent

- Greets visitors and asks what they need.
- Collects name, phone/email, location, urgency, service interest, and notes.
- Creates a lead record and suggests the next action.
- Must work even when the visitor starts with a generic question like "How much?".

Customer Service Agent

- Answers from the business knowledge base only.
- Handles hours, services, service area, pricing basics, booking steps, and policies.
- Escalates instead of guessing when the answer is unknown.
- Turns buying intent into a captured lead.

Quote Assistant

- Asks industry-specific intake questions.
- Builds a structured quote-ready summary for the owner.
- Only provides exact estimates when pricing rules are configured.
- Works especially well for cleaning, detailing, home services, rentals, beauty, and IT support.

Follow-Up Agent

- MVP drafts suggested follow-up messages.
- Flags leads that are new or stale.
- Later can send scheduled follow-ups via email/SMS/WhatsApp with consent.

Paperwork Assistant

- MVP turns messy messages into structured notes.
- Later can generate invoices, agreements, job sheets, and PDFs.

Sales Assistant

- Recommends the right service or product.
- Explains value and handles simple objections.
- Guides visitors to request a quote, book, call, or pay a deposit later.

5. MVP Boundary & 10/10 Quality Bar

Included in MVP	Excluded from MVP
Business onboarding and agent selection	Full omnichannel inbox
Business knowledge setup	Native WhatsApp Business API automation
Embeddable website widget	Instagram/TikTok DM automation
AI preview chat inside dashboard	Voice calls
Lead capture and mini CRM	Full visual workflow builder
Quote assistant templates	Full document generation engine
Usage tracking and plan limits	Enterprise CRM replacement
Billing and admin oversight	Unlimited AI conversations

Quality bar: A 10/10 MVP is not the largest product. It is the smallest version that feels complete, trustworthy, useful, and safe to pay for.

- The AI must not hallucinate business prices, policies, or availability.
- Every lead must save reliably with transcript and summary.
- The dashboard must make leads easy to review and act on.
- The widget must be fast, mobile-friendly, and safe to embed on external sites.
- Usage must be metered from day one to protect margins.
- Admin must be able to inspect problems during the pilot.

6. User Personas & Core Journeys

Persona	Pain	Best agent mix
Cleaning business owner	Missed calls, repetitive quote questions, uncertain job scope	Lead Capture + Quote Assistant
Auto detailer	Customers ask price without giving	Quote Assistant + Follow-Up

	vehicle details	
Beauty provider	Booking questions, style details, deposits, no-shows	Customer Service + Quote Assistant
Event rental company	Date availability, delivery details, surface/setup questions	Lead Capture + Quote Assistant
IT support/repair shop	Repetitive troubleshooting questions and unclear issue descriptions	Customer Service + Paperwork Assistant
Car rental business	Availability, dates, delivery, insurance, driver questions	Lead Capture + Customer Service

Business owner journey

1. Signs up and creates a business profile.
2. Chooses the main problem to solve.
3. Selects industry template and agent tone.
4. Adds services, FAQs, pricing notes, policies, and service area.
5. Tests the AI in preview mode.
6. Installs the widget script on the website.
7. Reviews captured leads in the dashboard.

Website visitor journey

8. Visitor opens the business website.
9. Widget greets the visitor or responds to a prompt.
10. Visitor asks a question or requests a quote.
11. AI answers from business knowledge and asks follow-up questions.
12. AI captures name, contact, need, location, and urgency.
13. AI confirms next step and saves the lead.
14. Business owner receives notification and acts from dashboard.

7. Widget Integration Architecture

The widget is the delivery mechanism. It should be simple for a business owner to install, but technically hardened enough for public traffic.

```
<script
  src="https://crecyai.app/widget.js"
  data-agent-key="agent_public_xxxxx"
  async>
</script>
```

Layer	Responsibility
Public script	Loads the widget shell without blocking the website.
Config API	Fetches safe public widget settings by agent public key.
Visitor session	Stores anonymous visitor/session id in localStorage or cookie.
Message API	Sends visitor messages server-side for AI processing.
Lead capture module	Collects contact fields inside the chat when intent is detected.
Fallback form	Displays a non-AI contact form when usage limit, error, or agent pause occurs.

Widget boot sequence

15. Website loads the async Crecy AI script.
16. Script reads data-agent-key from the embed tag.
17. Script calls GET /api/widget/config with public key and current domain.
18. Server validates allowed domain and returns safe public config.
19. Widget renders launcher and greeting bubble.
20. Visitor opens widget and sends message.
21. Widget posts message to /api/widget/message with session id and conversation id.
22. Server validates plan, rate limit, domain, and agent status.
23. AI engine generates reply and extracts lead fields if applicable.
24. Widget displays reply and lead capture state.

Widget states

- Closed launcher.
- Greeting bubble.
- Open chat.
- Lead capture form.
- Quote intake flow.
- Human handoff state.
- Conversation complete state.
- Plan limit fallback form.
- Error fallback form.

Widget security rules

- Use a public agent key, not internal database ids.
- Validate allowed domains server-side for every config and message request.
- Never expose system prompts or private business settings to the browser.
- Rate limit by IP, public key, domain, and visitor session.
- Apply message length limits before AI calls.
- Fallback gracefully if plan limit is reached or AI fails.

8. Dashboard Architecture

```

/ai
  Overview
/ai/onboarding
  Business setup and agent selection
/ai/agents
  Agent list and configuration
/ai/agents/[id]
  Agent settings, knowledge, behavior, install code
/ai/knowledge
  Business knowledge base
/ai/leads
  Lead inbox
/ai/leads/[id]
```

Lead detail, transcript, summary, notes, status
 /ai/conversations
 Conversation list
 /ai/analytics
 Usage, leads, conversion, top questions
 /ai/billing
 Plan, usage, invoices
 /ai/settings
 Widget branding, notifications, account settings

Dashboard page	Must show
Overview	New leads, conversations, capture rate, top questions, usage remaining, handoffs needed.
Agents	Agent name, mode, status, installed/uninstalled, usage, edit actions.
Knowledge	Services, FAQs, policies, pricing notes, hours, service area, custom entries.
Leads	Name, contact, service, location, urgency, score, status, source, created date.
Lead detail	Summary, transcript, structured intake answers, next action, notes, follow-up draft.
Analytics	Widget views, conversations, leads, conversion rate, top questions, handoffs, cost.
Billing	Current plan, usage, limits, upgrade CTA, billing status.

9. AI Engine Architecture

The AI engine must be modular and safe. Each agent uses the same core engine but different behavior instructions, questions, extraction rules, and output formats.

Engine function	Purpose
loadAgentConfig()	Loads mode, tone, greeting, limits, and behavior settings.
loadBusinessKnowledge()	Retrieves active knowledge entries for the business/agent.
buildSystemPrompt()	Builds safe instructions from business identity, agent mode, and rules.
detectIntent()	Classifies visitor intent: question, quote, complaint, buying intent, handoff.
shouldCaptureLead()	Decides if contact info should be requested.
extractLeadFields()	Extracts name, phone/email, need, location, urgency, budget.
generateAssistantReply()	Generates the user-facing answer.
generateSummary()	Creates conversation and lead summaries.
generateLeadScore()	Scores lead quality based on urgency, completeness, fit, and intent.
logUsage()	Stores model usage, tokens, estimated cost, and plan consumption.

Prompt layers

- Global safety rules: no guessing, no pretending to be human, no unsupported guarantees.
- Business context: business name, industry, service area, hours, contact methods.
- Agent mode: lead capture, customer service, quote assistant, follow-up, paperwork, sales.
- Knowledge base: only active entries relevant to the business.
- Conversation state: previous messages, missing fields, lead capture progress.
- Output rules: concise answer, next question, lead capture action, or handoff.

Handoff triggers

- Visitor asks for exact price and exact pricing is not configured.
- Visitor asks for legal, medical, financial, or regulated advice.
- Visitor complains, asks for refund, cancellation, or dispute resolution.
- Visitor requests a human.
- AI confidence is low or knowledge is missing.
- Visitor asks about availability/calendar that is not connected.

Safe AI copy: Fallback response: "I do not want to give you the wrong information. I can collect your details and have the team confirm this for you."

10. Database Schema Blueprint

The following schema is the build blueprint. Exact SQL can be generated from this table set, with RLS policies for owners, admins, and public widget access.

Table	Purpose	Key fields
ai_businesses	Business profile used for AI context	id, user_id, business_name, industry, website_url, phone, email, location, service_area, timezone, logo_url, brand_color
ai_agents	Configured AI agent/widget brain	id, business_id, agent_name, primary_mode, enabled_modes, tone, greeting, status, model_provider, model_name, lead_capture_enabled
ai_agent_knowledge	Business knowledge base	id, business_id, agent_id, type, title, body, metadata, is_active
ai_widget_installs	Public widget config and domain rules	id, agent_id, public_key, allowed_domains, widget_position, theme_color, show_branding
ai_conversations	Visitor conversation session	id, agent_id, business_id, visitor_id, source_url, source_domain, status, summary, intent, lead_id
ai_messages	Message transcript	id, conversation_id, role, content, metadata, created_at
ai_leads	Mini CRM lead record	id, business_id, agent_id, conversation_id, name, phone, email, service_interest, location, urgency, budget, lead_score, status, summary
ai_lead_events	Lead timeline and notes	id, lead_id, actor_type, event_type, message, metadata
ai_agent_usage	Usage and cost metering	id, business_id, agent_id, conversation_id, period, input_tokens, output_tokens, message_count, estimated_cost_cents
ai_agent_templates	Industry template definitions	id, industry, mode, questions, suggested_knowledge, prompt_rules
ai_billing_entitlements	Plan limits and feature gates	id, business_id, plan, max_agents, max_conversations, enabled_modes, billing_status
ai_admin_events	Admin audit log	id, actor_id, target_type, target_id, event_type, message, metadata

RLS/security model

Actor	Allowed access
Business owner	Full access to own businesses, agents, knowledge, conversations,

	leads, usage, billing view.
Public widget visitor	No direct table access; can only call public widget APIs with valid key/domain.
Admin	Full internal access for support, abuse review, billing oversight, and debugging.
System/service role	Writes conversations, messages, extracted leads, summaries, usage, and notifications.

11. API Contracts

Route	Method	Purpose
/api/ai/businesses	GET/POST	List or create business profile.
/api/ai/businesses/[id]	GET/PATCH	Read or update business profile.
/api/ai/agents	GET/POST	List or create AI agents.
/api/ai/agents/[id]	GET/PATCH/DELETE	Read, update, pause, or delete agent.
/api/ai/agents/[id]/knowledge	GET/POST	List or create knowledge entries.
/api/ai/widget/config	GET	Public widget config by public key and domain.
/api/ai/widget/message	POST	Public visitor message endpoint; validates usage and runs AI.
/api/ai/conversations	GET	Business conversation list.
/api/ai/conversations/[id]	GET	Conversation detail with transcript.
/api/ai/leads	GET	Lead inbox.
/api/ai/leads/[id]	GET/PATCH	Lead detail and status updates.
/api/ai/usage	GET	Current plan usage.
/api/ai/admin/*	VARIES	Admin-only oversight routes.

POST /api/ai/widget/message

Request:

```
{
  "public_key": "agent_public_xxxxx",
  "conversation_id": "optional",
  "visitor_id": "anonymous_session_id",
  "message": "How much is a move-out cleaning?",
  "source_url": "https://clientsite.com/pricing",
  "metadata": { "timezone": "America/New_York" }
}
```

Response:

```
{
  "conversation_id": "conv_xxxxx",
  "assistant_message": "I can help. How many bedrooms and bathrooms?",
  "lead_capture": { "active": true, "missing_fields": ["name", "phone", "location"] },
  "handoff_needed": false,
  "usage_remaining": 82
}
```

12. Billing, Usage & Entitlements

Plan	Monthly price	Entitlements
Free Trial	\$0	14 days, 1 agent, limited conversations, Crecy AI branding.
Starter	\$29	1 agent, 1 widget, lead capture, FAQ answers, 100 conversations/month.
Growth	\$79	3 agents, quote assistant, lead inbox,

		custom branding, 500 conversations/month.
Pro	\$149	All 6 modes, analytics, follow-up drafts, team access, 1,500 conversations/month.
Agency	Custom	Multiple client sites, white-label options, higher usage, priority support.

- Use Stripe for subscriptions and invoices.
- Meter conversations, AI messages, tokens, lead captures, and estimated cost.
- Never offer unlimited AI by default.
- When usage limit is reached, widget switches to fallback contact form instead of breaking.
- Past-due accounts should keep owner dashboard access but pause AI responses after grace period.

13. Security, Privacy & Abuse Protection

Risk	Required protection
Widget key theft	Allowed-domain validation and rate limits.
Prompt leakage	System prompts and private knowledge never returned to browser.
AI hallucination	Knowledge-only answers plus fallback/handoff rules.
Spam/abuse	IP/session/key rate limits, spam flags, admin pause action.
Runaway AI cost	Plan limits, token caps, message length caps, admin usage monitoring.
PII exposure	Minimum necessary data collection, secure storage, access only to owner/admin.
External site slowdown	Async script loading, CDN/static cache, non-blocking render.

- Collect only what is needed for the business to respond to a lead.
- Show a privacy notice in the widget before or during contact capture.
- Store conversation and lead data under the business owner account.
- Admin access must be logged in `ai_admin_events`.
- Public APIs must not rely on UI gating; validate server-side every time.

14. Admin Operations

Admin visibility is launch-critical. During pilot, admin should review conversations daily to catch incorrect answers, missing knowledge, abuse, and product friction.

Admin view	Purpose
Businesses	See customer accounts, billing state, trial status, owner info.
Agents	See active/paused agents, modes, install status, domains.
Conversations	Inspect transcripts, handoffs, failed answers, usage.
Leads	Review lead quality and summary usefulness.
Usage/cost	Monitor tokens, messages, estimated cost per account.
Errors	See failed model calls, API errors, widget failures.
Abuse/spam	Pause abusive agents or block spammy sources.

15. Industry Templates

Template	Core intake questions
Cleaning	Residential/commercial, service type, bedrooms, bathrooms, square footage, ZIP, desired date, pets, special requests.
Home services	Project type, interior/exterior, size/scope, location, timeline,

	photos, budget range.
Auto detailing	Vehicle year/make/model, interior/exterior/full detail, condition, mobile/drop-off, location, desired date.
Beauty/salon	Service requested, date/time, salon/mobile, style reference, hair type/length, deposit readiness.
Event rentals	Event date, item needed, delivery address, setup surface, start/end time, guest count.
IT support/repair	Device/system, issue, remote/onsite, business/personal, urgency, operating system.
Car rental	Rental dates, vehicle type, pickup/delivery, driver age, insurance status, driving distance.

Differentiator: Templates are a key moat. They make Crecy AI feel like a specialized business solution instead of a generic chatbot.

16. Build Roadmap

Phase	Goal	Acceptance
PR-0	Master product and technical plan	This document approved; no code changes.
PR-1	Database foundation	Schema, RLS, owner/admin access, usage tables.
PR-2	Business onboarding	Create business, choose industry/problem, create first agent.
PR-3	Knowledge setup	Add services, FAQs, policies, pricing notes, hours, service area.
PR-4	AI preview chat	Owner can test agent in dashboard; usage logged.
PR-5	Embeddable widget	Script loads externally, config validated, message API works.
PR-6	Lead inbox / mini CRM	Leads, summaries, transcripts, statuses, notes, follow-up draft.
PR-7	Quote templates	At least 6 industry templates with structured intake.
PR-8	Billing and limits	Stripe, entitlements, usage limits, fallback form.
PR-9	Admin oversight	Admin can inspect businesses, agents, conversations, usage, errors.
PR-10	Marketing site	Problem-based sales page with six agent cards and pricing.

17. Acceptance Criteria

Lead Capture Agent is complete when:

- A visitor can open the widget and ask a question.
- AI can answer using configured business knowledge.
- AI detects buying intent and requests contact details.
- Lead is saved with transcript, summary, contact info, need, location, and urgency.
- Business owner receives notification and sees lead in dashboard.

Customer Service Agent is complete when:

- AI answers common questions from services, FAQs, hours, policies, and service area.

- AI refuses to guess when information is missing.
- AI routes uncertain or sensitive questions to human handoff.
- AI captures the visitor as a lead when buying intent appears.

Quote Assistant is complete when:

- AI asks industry-specific questions based on the selected template.
- AI produces a structured quote-ready summary.
- Business owner can view intake answers in lead detail.
- AI avoids exact final pricing unless pricing rules exist.

Widget is complete when:

- The widget can be installed with one script tag.
- It loads asynchronously and works on mobile/desktop.
- It validates domain and public key server-side.
- It can continue or restore a conversation after page reload.
- It falls back to a contact form on errors or usage limit.

18. Pilot Launch Plan

Pilot element	Plan
Pilot size	5 to 10 businesses.
Best first businesses	Cleaning, auto detailing, beauty, event rental, IT support/repair, home services, car rental.
Offer	14-day free trial or founding customer plan at \$19/month for first 3 months.
Daily admin task	Review conversations, incorrect answers, missing knowledge, and lead summaries.
Success signal	At least 50 conversations, 10 qualified leads, and 2 businesses willing to pay monthly.
Margin signal	AI cost per customer stays comfortably below plan revenue.

- Do not promise full automation in the pilot.
- Position the product as lead capture, support, and quote assistance.
- Improve templates weekly from real conversations.
- Ask owners whether the AI summaries are useful enough to pay for.

19. Final Build Checklist

Area	Launch requirement
Product	Clear six-agent positioning with MVP focused on leads, support, and quotes.
Widget	Async embed, public config, message API, lead capture, fallback form.
Dashboard	Business setup, agent config, knowledge base, lead inbox, analytics, billing.
AI	Prompt layers, knowledge-only answers, extraction, summaries, lead scoring, handoff.
Data	Businesses, agents, knowledge, conversations, messages, leads, usage, entitlements.
Billing	Stripe subscriptions, usage limits, upgrade prompts, fallback on limit.

Security	Domain validation, rate limits, no prompt leakage, RLS, admin audit logs.
Admin	Visibility into businesses, agents, conversations, leads, usage, errors, abuse.
Pilot	5-10 businesses, manual review, weekly template improvements.

Final verdict: Crecy AI is ready to move from concept to technical implementation once this plan is translated into SQL migrations, API route files, widget code, AI engine modules, and dashboard pages.
